

Multi-Meter Set Application Note

Sonix Gas Meter

SONIX GAS METER

Problem

Traditional multi-meter sets take up significant space, quickly rust, becoming unattractive, and are expensive to produce. Your company must buy multiple components and then it is expensive to fabricate the set. In addition to the cost of the set, you must insure that multiple leak points don't leak. The bottom line – the multi-meter sets do not compete well against alternative energy sources.

Solution

Sonix meters use patented ultrasonic technology that enables them to be installed, and operate accurately, in any orientation. As a result, you can benefit by having an alternative to the bulky, awkward diaphragm meter by offering your customer the state-of-the-art Sonix gas meter that significantly reduces meter set size, complexity, and cost, and is aesthetically pleasing.

The meter set is compact and easily allows installation in tight spaces – saving your customer space and money.

The meter set has fewer components – which means fewer potential leak paths and reduced component cost.

The bottom-line – you have a product that you can sell to your customers that is aesthetically pleasing and will save them space, two key considerations when they are choosing an energy source for their properties.

This product incorporates technology licensed from British Gas plc.
